ET6H3XX - High Input Very-Low IQ 300mA LDO

General Description

ET6H3XX series are the high input very low I_Q 300mA LDO with enable function that operates from 1.8V~5V, is designed specifically for portable battery-powered applications which require ultra-low quiescent current. The very-low consumption of type 3.0 μA ensures long battery life and dynamic transient boost feature improves device transient response for wireless communication applications.

ET6H3XX series are offered SOT89-3, SOT89-5, SOT23-5, SOT23-3, DNF4(1mm x 1mm) packages

Features

- Wide Input Voltage Range from 2.8V to 45V
- Up to 300mA Load Current
- Very Low I_Q is 3.0 μA Typical
- Fixed Output Voltage are 1.8V,2.5V,2.8V,3.0V,3.3V,3.6V,5V, etc
- Low Dropout is 1000mV at 300mA Load @V_{OUT} = 3.3V
- Excellent Load/Line Transient Response
- High Ripple Rejection: 70dB at 1KHz
- Packages are SOT89-3, SOT23-5, SOT23-3, DFN4 (1mm × 1mm)

Functional Description

Input Capacitor

A 1μF~10μF ceramic capacitor is recommended to connect between VIN and GND pins to decouple input power supply glitch and noise. The amount of the capacitance may be increased without limit. This input capacitor must be located as close as possible to the device to assure input stability and less noise. For PCB layout, a wide copper trace is required for both VIN and GND.

Output Capacitor

An output capacitor is required for the stability of the LDO. The recommended output capacitance is from 1μF to 10μF, Equivalent Series Resistance (ESR) is from 5mΩ to 100mΩ, and temperature characteristics are X7R or X5R. Higher capacitance values help to improve load/line transient response. The output capacitance may be increased to keep low undershoot/overshoot. Place output capacitor as close as possible to OUT and GND pins.

Enable (If EN PIN Exist)

The ET6H3XX delivers the output power when it is set to enable state. When it works in disable state, there is no output power and the operation quiescent current is almost zero. The enable pin (EN) is active high.

Dropout Voltage

The ET6H3XX uses a PMOS pass transistor to achieve low dropout. When (V_{IN} - V_{OUT}) is less than the dropout voltage (VDO), the PMOS pass device is in the linear region of operation and the input-to-output resistance is the $R_{DS(ON)}$ of the PMOS pass element. VDO scales approximately with output current because the PMOS device behaves like a resistor in dropout mode. As with any linear regulator, PSRR and transient response degrade as (V_{IN} - V_{OUT}) approaches dropout operation.

Thermal Shutdown

Thermal shutdown protection disables the output when the junction temperature rises to approximately 155°C.Disabling the device eliminates the power dissipated by the device, allowing the device to cool. When the junction temperature cools to approximately 125°C, the output circuitry is again enabled.

Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits regulator dissipation, protecting the LDO from damage as a result of overheating. Activating the thermal shutdown feature usually indicates excessive power dissipation as a result of the product of the (V_{IN} - V_{OUT}) voltage and the load current. For reliable operation, limit junction temperature to 125°C maximum.

Thermal Considerations

For continuous operation, do not exceed absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated by the following formula:

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where $T_{J(MAX)}$ is the maximum junction temperature, T_A is the ambient temperature, and θ_{JA} is the junction to ambient thermal resistance.

For recommended operating conditions the maximum junction temperature is 150°C and T_A is the ambient temperature. The junction to ambient thermal resistance (θ_{JA}) is layout dependent.

For SOT89-3 package, the thermal resistance (θ_{JA}) is135°C/W on the test board. The maximum power dissipation at T_A = 25°C can be calculated by the following formula:

$P_{D(MAX)}$ = (150°C - 25°C) / (135°C/W) = 0.925W for SOT89-3 package

The maximum power dissipation depends on the operating ambient temperature for fixed $T_{J(MAX)}$ and thermal resistance (θ_{JA}). The derating curve in Figure 6 allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

Current-Limit Protection

The ET6H3XX provides current limit function to prevent the device from damages during over-load or shorted-circuit condition. This current is detected by an internal sensing transistor.

Layout Guidelines

- Place input and output capacitors as close to the device as possible.
- Use copper planes for device connections in order to optimize thermal performance.
- Place thermal vias around the device to distribute heat.
- Do not place a thermal via directly beneath the thermal pad. A via can wick solder or solder paste away from the thermal pad joint during the soldering process, leading to a compromised solder joint on the thermal pad.

Absolute Maximum Ratings

Symbol	Rating	Value	Unit
V_{IN}	Input Voltage[(1)]	-0.3~53	V
V_{OUT}	Output Voltage	-0.3~6	V
V_{EN}	Chip Enable Input (If EN PIN Exist)	-0.3~53	V
$T_{J(MAX)}$	Maximum Junction Temperature	150	°C
T_{STG}	Storage Temperature	-55~150	°C
V_{ESD} [(2)]	HBM Capability	±4000	V
	CDM Capability	±1500	V
I_{LU} [(2)]	Latch up Current Maximum Rating	±200	mA

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Note3. Here V_{IN} means internal circuit can work normal. If $V_{IN}<V_{OUT}$, Output voltage follows V_{IN}(I_{OUT}=1mA), circuit is safety.

Note4. V_{DROP} FT test method: test the V_{OUT} voltage at $V_{SET}+V_{DROPMAX}$ with 300mA output current.

Note5. Guaranteed by design and characterization. not a FT item.

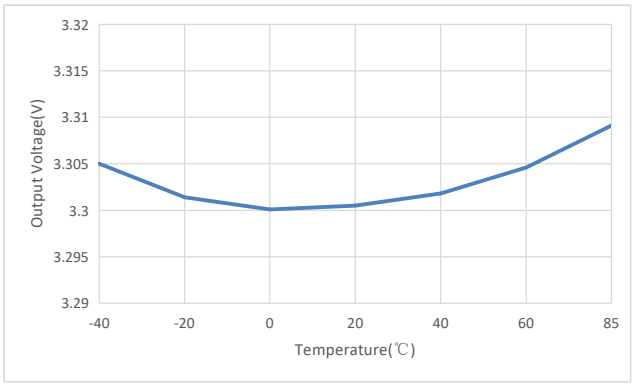

Note6. At high temperatures, the maximum load current can be calculated according to the following formula：

$$I_{OUT_MAX} = (T_J - T_A) / R_{\theta JA} / (V_{IN} - V_{OUT})$$
